REMARKS: The demand figures are based on the published series "consommation de produits industriels". To this is added net exports of manufactured consumer goods, deflated to 1963 prices using the consumer price index for manufactured goods.

The production figures are obtained by converting the industrial production index for consumer goods (base 1970=100) into 1963 francs. The conversion factor was chosen so that, for the 1971-1973 period, the average demand figures in the table fall short of average production by 2.3%. This estimate of net addition to inventories, in turn, was obtained by looking at French input-output tables for those years.

Note that the second decimal in the numbers for production is not meaningful, because the underlying industrial production index contains only three significant digits.
